Sengstack Perturb-seq, fibroblast line, 36,514 cells in three barcode groups
WT, no guide (6,809 cells)
PD14 581 early passage
PD26 1,880
PD32 4,348 late passage
PD14 and PD32 define the target and the aging axis
Target 1: early-passage cells
PD14 (half A), same line and experiment
aging axis a = PD14 − PD32 (half A)
Figs 2–4: change in distance to PD14
displacements go to both targets
CRA, activation (14,333 cells)
167 perturbations
non-targeting (NT) 666 cells
displacement = perturbation − own NT
CRI, interference (15,372 cells)
173 perturbations
non-targeting (NT) 1,479 cells
displacement = perturbation − own NT
Target 2: young human donors
GTEx donors aged 20–39 (n = 113)
origin: GTEx donors 60–79 (n = 231)
displacement applied to the old centroid
Fig 4: change in distance to young
