Sengstack et al. Perturb-seq data: one neonatal dermal fibroblast line, 36,514 cells
Wild-type cells (6,809)
Early passage, PD14 581
Middle passage, PD26 1,880
Late passage, PD32 4,348
CRISPR activation screen (14,333)
200 transcription factors switched on
167 with at least 30 cells, analyzed
666 non-targeting control cells
CRISPR interference screen (15,372)
200 transcription factors switched off
173 with at least 30 cells, analyzed
1,479 non-targeting control cells
defines young and old
each perturbation's effect, relative to the control cells of its screen, is tested against both targets
Target 1: early-passage cells
Same experiment. Young = PD14, old = PD32.
Figures 2 and 3
Target 2: young human donors
GTEx fibroblasts: 113 donors aged 20–39 (young),
231 aged 60–79 (old). Figure 2
